

Did having an NDE at a young age make any difference in your life?

## **THE FOREVER ANGELS: NEAR-DEATH EXPERIENCES IN CHILDHOOD AND THEIR LIFELONG IMPACT**

by P. M. H. Atwater, L.H.D.

Read the first in-depth report ever done on those between birth and age five. **THE FOREVER ANGELS** covers the “full round” of NDE aftereffects throughout one’s life, from birth to death.

- Two studies were combined: The first took decades and was of very young children who were looking forward in life. The second, a 3-year study begun in 2015, was primarily with those now in their senior years (the oldest at age 86) who could verify having had a near-death experience between birth and age five. They looked back at their lives – hoping to answer one question: Does having had an NDE at such a young age make a difference? If so, what?
- Read the accounts of 397 people who can remember their birth, being in the womb, or even their own conception (later confirmed by their parents – shocking them).
- **THE FOREVER ANGELS** seeks to answer what changes when the “power punch” of a near-death experience happens to the very young brain/mind assembly, nervous and digestive systems, skin sensitivity, or the flow of consciousness itself. Why do most remember “the other side” as a flowing stream of consciousness, the comings and goings of a spirit beyond form?
- **THE FOREVER ANGELS** also explores why most child experiencers do not bond with parents —seeming to remain connected to “the other side.” Why are they often considered psychic/intuitive or empathic. Most become highly successful in life but at the same time harbor thoughts of suicide – wishing to get back to their “real home.” This is so prevalent, regardless of age, that an entire chapter, “PTSDs vs NDEs” is devoted to it.
